CodeAlpha Data Science

Submission checklist • Four completed projects

Based on the uploaded CodeAlpha M1 task PDF and the supplied “Before You Start” screenshot. This is preparation guidance, not proof of official submission or internship completion.

Prepared files

Each public project repository contains Python source, an executed notebook, the supplied data, results, charts, a README, and PDF/Word design reports. Video scripts, LinkedIn drafts and project descriptions are included with these submission materials.

☐ Review the projects, understand the results and practise explaining the methods before submitting them as your work.

Repository links for the official form

Task 1 • Iris Flower Classification

Classifies three species; logistic regression achieved 100% accuracy on 30 held-out flowers. A small educational evaluation.

https://github.com/nisa3131/CodeAlpha_IrisFlowerClassification

Task 2 • Unemployment Analysis

Describes Covid-period differences, participation and matched rural/urban patterns. No causal or official national estimate is claimed.

https://github.com/nisa3131/CodeAlpha_UnemploymentAnalysis

Task 3 • Car Price Prediction

Random forest tested on unseen vehicle-name groups: MAE 2.0562 in dataset price units; R^2 0.5839.

https://github.com/nisa3131/CodeAlpha_CarPricePrediction

Task 4 • Sales Prediction

Quadratic ridge: test MAE 0.485 and R^2 0.988. The undated data do not validate a future-period forecast.

https://github.com/nisa3131/CodeAlpha_SalesPrediction

How many tasks should you select?

The PDF says to complete any **2 or 3 of the 4 tasks**. All four are prepared. Follow the official form’s task-count fields; if it permits only two or three, select that many completed projects. The actual form controls the files and links you must supply.

Finish the official submission

The remaining actions require your review, recording and account access. Nothing has been posted to LinkedIn or submitted to an official form for you.

1. Review your work

Open the notebooks and reports; confirm you can explain the data, preprocessing, evaluation, results and limitations.

2. Share internship status on LinkedIn

Use LINKEDIN_DRAFTS.txt as a starting point. Check your real internship details and select the correct CodeAlpha page to make the required tag active.

3. Record a project explanation video

Use VIDEO_EXPLANATION_SCRIPTS.md as prompts. Show the relevant code/notebook, a main chart, the measured results and a limitation. Record the explanation in your own words.

4. Post the explanation video with the repository link

Publish the required project video post(s) on LinkedIn with the matching GitHub URL(s). Follow any extra instructions from the official group or form. Save the post URL(s).

5. Find the official submission form

The PDF says tasks must be submitted only through the form shared in your CodeAlpha WhatsApp group. Check the group or email for current instructions. No form URL or deadline was supplied here.

6. Submit the official form yourself

Have your real Student ID ready if requested. Enter repository and LinkedIn links, attach files only where requested, check the actual deadline and retain the confirmation.

Keep these downloads

Keep the complete submission ZIP (or separate project ZIPs), the combined PDF and editable Word report, and this submission-materials set. Individual reports are inside each project. The supplied PDF does not prescribe a ZIP filename or require a separate report upload; follow the form’s requested fields.

Final check

☐ Chosen repository links open publicly and match the tasks.

☐ The internship-status post tags the correct CodeAlpha page.

☐ Required video post(s) include the matching repository link(s).

☐ Your real name, Student ID and internship details match official records.

☐ Task-count limits, fields and the deadline in the official form are followed.

☐ The submission confirmation is saved privately.

A GitHub upload, ZIP download or report does not replace the official form. No Student ID, deadline, certificate eligibility decision or certificate is invented here.
